EasyLevel, the feed pan is raising with your birds !!

First Day :

The feed line must be descended down to floor, with the lifting winch. A very simply mechanism located at the bottom of pan, that consists in six black rods, connected to a black disk, push up the yellow feed cone to the border ring.

The little chicks, eat outside from the border of pan since the first day. There is not space in the pan for sleeping broilers. As the same yellow feed cone is performing as a divisor grill with flaps.

No birds in the pan.

Third Week :

To prevent undesired waste of feed, is necessary to check almost every day, if there is too much feed in the pan.

Lift a little more the feed line, closing down yellow feed regulator.

Also is better that feed not remains, too much hours in the pans.

First Week :

Is no needed to maintain feed level completely opened. Raise a little the feeding line, to reduce feed level.

Rest of the Flock :

When you raise completely the feed line, and feed pans do not touch the litter floor, the feed regulation position, will be at the lowest point (position 1-2).

This final position never changes. It,s only needed to fix at the first time that feed pans are installed.

With this final position, broilers need to take feed from the inner bottom of pan, preventing wastage and feed choice or selection of ingredients, specially with pellet feed.

This is the best way to obtain a good conversion index, Simply using the lifting winch.
